1 About this Book

1.1 Audience

This book is for those who want to run the Appeon native mobile applications in Appeon Workspace.

1.2 How to use this book

This book provides information that enables you to download and install Appeon Workspace, and manage your Appeon native mobile applications in Appeon Workspace.

Chapter 1: gives a general introduction of this guide.

Chapter 2: introduces the layout, workflow, architecture, and major features of Appeon Workspace.

Chapter 3: gives instructions on adding, editing, closing, and deleting applications in Appeon Workspace.

Chapter 4: describes the configuration settings in Appeon Workspace.

Chapter 5: describes the interfaces to the Appeon Workspace help, the copyright information, and the Appeon Workspace ID.

2 Introduction to Appeon Workspace

Appeon Workspace provides its intended audience the perfect tool for managing Appeon Mobile applications conveniently.

2.1 What is Appeon Workspace

Appeon Workspace simplifies distributing, accessing, and updating the native mobile application converted via Appeon Mobile. Appeon Workspace itself is a native mobile application which is publicly available on the online app stores such as Apple App Store, Android Market (Google Play), etc.

Figure 2.2: Appeon Workspace on iPhone:

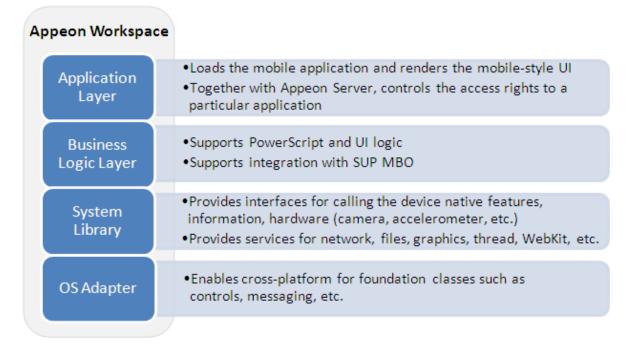

Note: the task bar will not be available if there are no running applications. If you have not

pinned it by tapping the pin icon (), it will be automatically hidden after it is shown for a few seconds. Flick up at the bottom of the Appeon Workspace home screen to show the task bar if it is hidden.

Appeon Workspace is implemented using universal C++ libraries and JavaScript libraries. The C++ libraries render the mobile-style UI and provide interfaces for calling the device native features, information, and hardware (camera, accelerometer, etc.); while the JavaScript libraries support the PowerScript and UI logic coded in the Window object, user object, menu object, and any other visual objects.

The following diagram illustrates the Appeon Workspace architecture.

2.2 Why using Appeon Workspace

Appeon Workspace is an alternative method for distributing the native mobile application. In summary, the Appeon native mobile application can be distributed and accessed in the following two ways:

1. Traditional methods for pure native applications

By building Appeon mobile applications to standard .IPA files (iOS) or .APK files (Android), the following distribution strategies can be used:

- a. End-users can perform the installation wirelessly by using a direct URL.
- b. IT administrators can use a private MDM server to instruct managed devices to install the native mobile app automatically.
- c. Developers can upload and distribute publicly via the Apple App Store and Android Market (Google Play).
- 2. Special method provided by Appeon -- Appeon Workspace

Developers only need to deploy the Appeon native mobile applications to Appeon Server via the Appeon Developer toolbar. End users will first download and install Appeon Workspace from the Apple App Store to the device, and then download, install and run the Appeon native mobile application in Appeon Workspace.

Appeon Workspace is highly recommended over the traditional methods, because it has the following advantages:

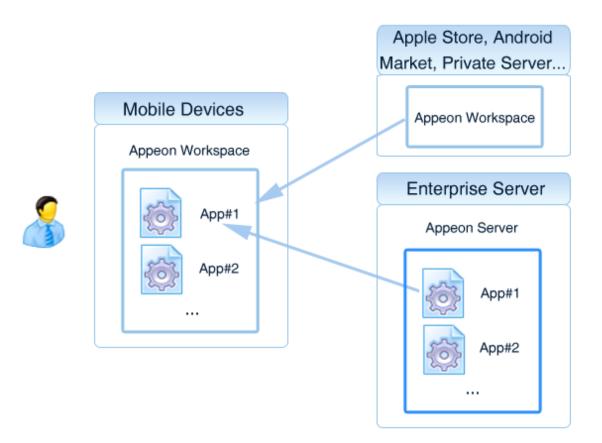

Advantage 1: Greatly simplify distributing and running applications

The traditional methods aforementioned are commonly recognized as time-consuming and cumbersome; especially the 3rd method, though most widely used now, it puts the application through lengthy approval process, and it poses high risk of being rejected. Besides that, each OS vender runs their own online app stores and follows their own rules and procedures to approve applications, developers will need to spend tremendous time and efforts getting the application approved in each of these stores. For example, the Apple App Store requires the developer to be enrolled in the Apple Developer Program and obtain an Apple Development Certificate first.

Appeon Workspace will connect to the Appeon Server, and download, install, and run the Appeon mobile apps, as illustrated in the following diagram:

- 1. Appeon will distribute Appeon Workspace to all of the mainstream online app stores;
- 2. Developers only need to deploy their mobile apps to the application server;
- 3. The end user will first download Appeon Workspace from app store like any other native apps and then add and run the deployed Appeon mobile apps in Appeon Workspace.

Figure 2.4: Appeon Workspace workflow

Advantage 2: Greatly facilitate application upgrade (especially for apps hosted as SaaS)

Reason is mostly the same as described above. Without needing to build and distribute the .IPA or .APK file, developers only need to deploy the mobile apps to Appeon Server by using the Appeon Developer toolbar. When Appeon Workspace runs the mobile apps, it will check for the update and automatically upgrade the application.

Advantage 3: Securely manage applications

Appeon Workspace allows users to manage the access rights of a particular mobile app according to user groups. Once the Appeon Workspace security is turned on in AEM, the end user will need to register their Appeon Workspace ID in AEM before they can access the application in Appeon Workspace.

Advantage 4: Facilitate application debug

Appeon Workspace generates detailed log information to help analyze and debug application errors. End users can turn on or off the logging feature according to their actual needs.

Advantage 5: Support Mobile + Multi-Cloud runtime environment

Appeon Workspace turns Mobile + Cloud and even Mobile + Multi-Cloud into reality. Appeon supports the mainstream cloud services, therefore, developers only need to deploy the mobile application to any cloud-based server, and end users can connect to different cloud servers in Appeon Workspace.

2.3 Features

2.3.1 Supporting multiple OS and devices

Appeon Workspace is designed to run on various mobile OS and mobile devices. See the following table for details.

Supported OS	Supported devices	Available in
iOS	iPad 2, iPad 3, iPad 4, iPad mini, iPhone 4/4S, iPhone 5, iPod Touch 4, and iPod Touch 5	Version 1.0
Android OS	Android-based smartphones and tablets	Version 1.5
Windows Phone	Windows-Phone-based smartphones and tablets	Version 2.0

Table 2.1: Supported OS and devices

2.3.2 Hosting multiple native mobile apps

You can add as many apps as you like to Appeon Workspace, with the application icon, name, and a brief application description displaying on the Appeon Workspace home screen. This adds better recognition and access to your Appeon Mobile apps. You can flick with your fingers to slide from screen to screen on your device to view your apps when there is more than one screen apps listed on the Appeon Workspace home screen. For detailed instructions on adding/closing/editing/deleting the applications in Appeon Workspace, refer to Running apps in Appeon Workspace.

2.3.3 Displaying in portrait and landscape

Appeon Workspace can be viewed in either portrait or landscape orientation -- you just rotate the device to change the orientation. By default, it is initially displayed in the orientation you hold your device.

2.3.4 Adding extra security to applications

Appeon Workspace adds extra security to applications. In AEM (Appeon Enterprise Manager), you can configure whether a user (an Appeon Workspace Client ID) has access to a particular application. For details, refer to the *User Management*, *Group Management*, and *Client Security* sections in the *AEM User Guide*. Also, in Appeon Workspace, you can enable the SSL Verify Peer option to make the access to applications safer. For details, refer to <u>SSL</u> verify peer.

2.3.5 Providing configurations to applications

Appeon Workspace provides a number of configuration options to the mobile application, such as the server connection timeout, the display of titlebar, the display of the advertisement banner, languages, logs etc. For details, refer to <u>Configuring Appeon Workspace</u>.

2.3.6 Customizing Appeon Workspace

Appeon Workspace are customizable. You can change Appeon Workspace into your own workspace by customizing the UI, such as icons, UI texts, the workspace banner, languages, etc., in Appeon Developer and distribute it to online app stores. For details, refer to *Customizing and Packaging Appeon Workspace* in *Appeon Developer User Guide*.

2.4 Installing Appeon Workspace

Downloading and installing Appeon Workspace from the App Store is no different from downloading and installing any other apps from the App Store. Tapping the **Install** button will automatically start the download and install process on a mobile device.

You can also download the app from the App Store to your PC or Mac, and then sync the app to your Apple mobile device via iTunes.

3 Running apps in Appeon Workspace

3.1 Adding applications

Appeon Workspace provides several ways to add applications.

Step 1: Use one of the following methods to open the Add App screen.

Tap the add icon $(\textcircled{\bullet})$ on the left of the titlebar; or	
Add App	
Tap here to add a new app.	
Tap the Add App icon (when there is no apps installed) in the data area; or) (only available

Tap the settings icon () on the right of the titlebar, then tap the **Settings** option on the popup menu, and then tap the **Add App** option.

The Add App screen appears, as shown in the following figure.

Figure 3.1: Add a new app

\odot	Add App	
	App URL	
	http://	
	Example: http://demo.appeon.com/sales	
	Test Connection	

Step 2: In the **App URL** text box, enter the application URL.

Both HTTP and HTTPs formats are supported in Appeon Workspace running on mobile devices. But in Appeon Workspace Emulator on Windows, only the HTTP format is supported.

Step 3: Tap the **Test Connection** button to test the app URL connection. Make sure that the connection is successful.

Step 4: Tap the back icon ()) on the left of the titlebar to save the information and return to the previous screen.

Once the application information is saved successfully, the application will appear in the data area on the Appeon Workspace home screen, and will start the download and install process immediately, as shown in the following figure.

Figure 3.2: Download and install apps

The added applications will queue up and will be automatically downloaded and installed once the previous application is finished.

During the download and install process, you can pause and resume the process by tapping

the ^{***} icon. For example, suppose you want to download and install application_2 first instead of application_1, you can pause the process for application_1 and tap application_2 to start the download and install process for application_2.

Figure 3.3: Apps line up to be installed

3.2 Running applications

Once the download and install process of the added application is complete, you are ready to access it in Appeon Workspace.

Tapping an application icon or name in the data area on the Appeon Workspace home screen will start to run the application. Applications in running will be listed in the task bar (bottom area) on the home screen as a small application icon, as shown in the following figure.

Figure 3.4: Appeon Workspace task bar

More than one application can be run at the same time, but only one can be displayed in the foreground and be available for accessing.

In the task bar, you can flick with your fingers to slide from screen to screen to view more applications in running, if there is more than one screen (applications) listed.

3.2.1 Running apps in full screen

You can tap the hide titlebar icon () on the right of the titlebar to view the application in full screen (without the titlebar) at runtime, as shown in the following figure.

Figure 3.5: Window with titlebar hidden

Tap the show titlebar icon () on the top right corner of the window to return to the normal view.

If the **App Titlebar** option under **General** is turned off (it is turned on by default), the application will run without the titlebar as it is opened).

3.2.2 Bringing applications to foreground

When you tap the home icon (()) on the left of the titlebar to quit the application and return to the Appeon Workspace home screen, the application will remain in the background, and will be listed in the task bar. When you tap the application icon in the task bar, the application will be brought to the foreground again, and become visible for your manipulation.

Figure 3.6: Appeon Workspace task ba

3.3 Closing applications

To completely remove the application from memory, you will need to exit the application from the background, by one of the following ways:

• Method 1: Close the apps in the task bar one by one.

Step 1: Press and hold any application icon in the task bar until a red close sign () appears on the upper left corner of each application icon, as shown in the following figure.

Figure 3.7: Applications to be closed

Step 2: Tap the close sign of the application you intend to close. The application is then closed.

• Method 2: Close all the running (both in the foreground and background) apps at once.

Figure 3.8: Close all apps

	*
Settings	
Close All Apps	
Help	
About	

Method 3: Close the application using the close app icon () on the application titlebar. Tap the close app icon on the app titlebar and tab **OK** in the popup dialog box to close the

app.

You can hide the close app icon using the *of_setcloseappiconvisible* function. For details, refer to *Workaround & API Guide*.

• Method 4: Close the application using the close option in the application.

Alternatively, if the application provides the close option in the window list icon (as shown in the figure below), you can also tap the close option to exit the application from the memory.

Figure 3.9: Close option under settings

3.4 Editing applications

Appeon Workspace provides availabilities to edit the application URLs.

To edit an application, do the following:

Step 1: Tap the settings icon () on the titlebar, and then tap the **Settings** option in the menu that appears.

Step 2: In the **Installed Apps** list on the **Settings** screen, tap the application name and URL you want to revise, as shown in the following figure.

Figure 3.10: Editing the app settings

	Test Connection Delete App	

Step 4: Tap the **Test Connection** button.

Step 5: Tap the back icon () on the titlebar to return. The changes you made will be automatically saved.

3.5 Deleting applications

To delete an application from Appeon Workspace, do the following:

Step 1: Tap the settings icon ()) on the titlebar, and then tap the **Settings** option in the menu that appears.

Step 2: In the **Installed Apps** list on the **Settings** screen, tap the application name and URL you want to delete, as shown in the following figure.

Figure 3.12: Deleting installed apps

	Delete App	

The application is then deleted from Appeon Workspace and the device.

Note: Applications in running cannot be deleted.

4 Configuring Appeon Workspace

Appeon Workspace provides many configurations, such as App Titlebar, Logging, etc. Go

to the **General** screen by tapping the settings icon (**Settings** > **Settings** > **General**, and the **General** screen appears, as shown in the following figure.

Figure 4.1: General

SSL Verify Host ON ON Connection Timeout (seconds) 15 Default App None 2 Language English 2	Workspace Banner	ON ON
Connection Timeout (seconds) 15 Default App None 2 Language English 2	SSL Verify Peer	ON O
Default App None 2 Language English 2	SSL Verify Host	ON
Language English	Connection Timeout (seconds)	15
	Default App	None
Logging On 2	Language	English
	Logging	On 2

4.1 Hiding titlebar

On the **General** screen, tap the **App Titlebar** (**ON/OFF**) button to enable or disable it. If it is disabled, the application titlebar will be hidden when you access your mobile applications.

Figure 4.2: Hiding titlebar

App Titlebar

After you make changes to this setting, you will need to restart the application to make the new setting effective.

4.2 Displaying workspace banner

On the **General** screen, tap the **Workspace Banner** option to enable or disable it. By default, it is enabled.

ON

Figure 4.3: Displaying banner

Workspace Banner

If you have disabled it, the workspace banner will be hidden from the Appeon Workspace home screen, as shown in the following figure.

Figure 4.4: Advertisement bar is hidden

4.3 SSL verify peer

Appeon Workspace provides options to enable the SSL peer verification to verify the server's CA.

On the **General** screen, tap the **SSL Verify Peer** (**ON/OFF**) button to enable or disable it, as shown in the following figure.

Figure 4.5: SSL verify peer

SSL Verify Peer

If you have enabled this option, when an unmatched CA is detected, the communication will be terminated immediately.

4.3.1 SSL verify host

The SSL host verification option is provided to verify the server hostname. It will be available when SSL Verify Peer is enabled.

ON

On the **General** screen, tap the **SSL Verify Peer** (**ON/OFF**) button to enable or disable it, as shown in the following figure.

Figure 4.6: SSL verify host

SSL Verify Host

15

If you have enabled this option, when an unmatched host is detected, the communication will be terminated immediately.

4.4 Configuring connection timeout

Appeon Workspace provides the option to configure timeout settings for applications connecting to corresponding servers. If the application cannot connect to the corresponding server successfully within the specified time, users will be prompted.

On the **General** screen, type any number in the **Connection Timeout** (seconds) text box to set the timeout. By default, it is 15 seconds.

Figure 4.7: Connection Timeout

Connection Timeout (seconds)

4.5 Default App

You can specify an application as the default app, so when Appeon Workspace is opened, this application will be automatically run in Appeon Workspace.

To set an application as the default app:

Step 1: On the General screen, tap Default App.

All of the added applications will be listed, including a None option.

Figure 4.8: Setting up Default application

\odot	Default App	
	None	·
	SAP TechEd2012 Demo http://demo.appeon.com/sapteched	
	Sales App Demo http://demo.appeon.com/sales	
	ACF Demo http://demo.appeon.com/acf	
	Code Examples Demo http://demo.appeon.com/codeexamples	

Step 2: Tap the application you want to set as the default app, or tap **None** if you do not want any application to run as the Appeon Workspace opens.

4.6 Configuring UI languages

To configure the Appeon Workspace UI language, tap the **Language** option on the **General** screen, and then select a language you prefer from the language list on the **Language** screen that appears.

Figure 4.9: Language settings

SIM	20:12	100%

4.7 Configuring logs

Appeon Workspace provides several configuration options for managing logs.

On the **General** screen, tap the **Logging** option to configure the relevant log settings.

Figure 4.10: Logging

\odot	Logging	
	Record Logs	ON
	Clear All Logs	
	SAP TechEd2012 Demo http://demo.appeon.com/sapteched	>
	Sales App Demo http://demo.appeon.com/sales	>
	ACF Demo http://demo.appeon.com/acf	>
	Code Examples Demo http://demo.appeon.com/codeexamples	>

See the following table for details on each option.

Table 4.1: Log settings

Items	Descriptions
Record Logs	Enable it to record application logs on your mobile device.
Clear All Logs	Tap it to clear all logs recorded on your device.

Note: The log settings (options) will only be available for configuration on the condition that one of the log modes (except the **OFF** mode) is enabled in AEM. See the *Mobile Client Log* section in the *AEM User Guide* for details.

You can also configure logs for a particular app on the same screen. In this section, we take the app *SAP TechEd2012 Demo* as an example.

Step 1: Tap the application name *SAP TechEd2012 Demo*, and the **App Logs** screen appears, as shown in the following figure.

Figure 4.11: Log settings for an app

iPad 🗟	F ※ 11:34	12% 🗔
